Jennah, the report is on the web site.

The passive gas sampling had some positive results that indicate there is the potential for the waste/contaminated area to produce vapors. This is a screening test, and that is the only conclusion that can be assessed. The passive gas sampling is done as an initial step to determine whether vapors are being produced by the contamination.

Vapor intrusion sampling was also completed. There are vapor intrusion results slightly above the screening numbers. The dwellings that were sampled are vacant; therefore, there is no current exposure to any resident.

Hi Katrina,

The DEQ press office said their folks told them this was an EPA test. Do you know about these tests?

*What are the results from the passive gas and vapor intrusion sampling DEQ did at Bristow Wilcox Superfund Site in the fall of 2016?*

*Please provide documentation of those test results.*

Thanks,

Jennah
